

AI Workspace Platform — Database ERD

Database Entity-Relationship Diagram

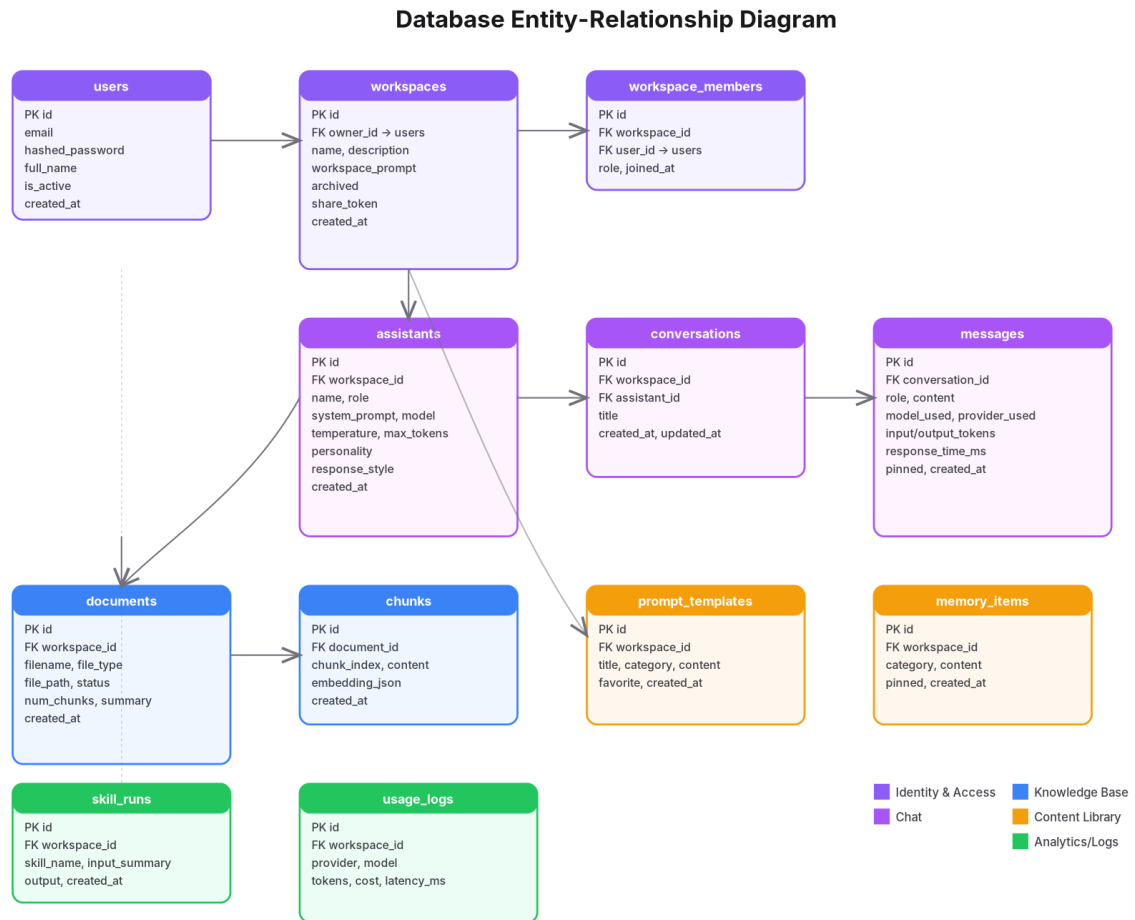

Figure 1. Database Entity-Relationship Diagram

ERD Explanation

The diagram represents the database structure of the AI Workspace Platform and shows the entities and relationships used to organize application data. The following explanation describes the entities and connections visible in the supplied ERD.

The ERD provides a visual view of how the platform's database entities are organized and connected. Each entity represents a logical group of stored information, while the connecting lines indicate relationships between the corresponding entities. This structure supports persistent storage and keeps related workspace data connected within the application.

The diagram should be read from the entity boxes and their connecting relationships rather than as a processing flow. It is therefore complementary to the system architecture

diagram: the architecture describes application components and data flow, while this ERD describes the database-level organization of the application's persistent data.
